

Measuring Adoption of Open Source Software and Practices in Organizations

A Pilot Study

Georg Link, Jerry Gill, Deepak Khazanchi

Presented by Georg Link
MWAIS, Springfield, IL, 05/18/2017

Agenda

- Background: Organizational OSS/P Adoption
- Research Question
- OSS/P Adoption Instrument Development
- Pilot Study
- Conclusions

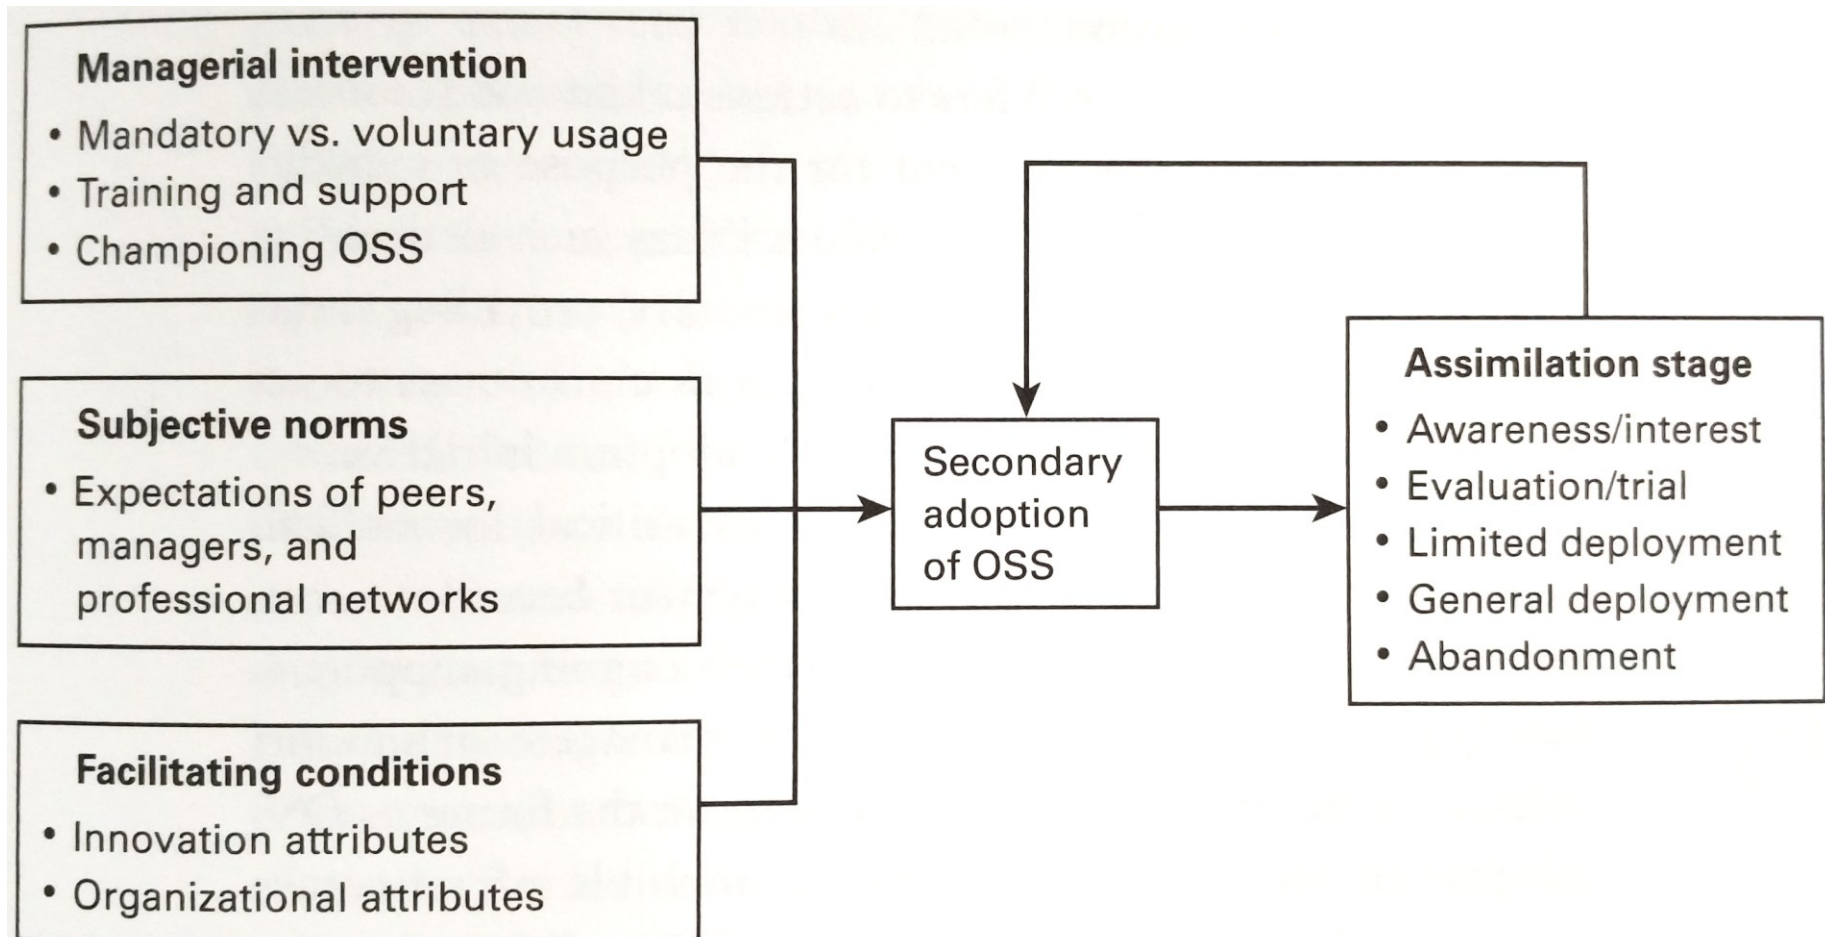

Organizational OSS/P Adoption

- **Spreading quickly** (Black Duck 2016)
- **Much qualitative research** (Thanasopon 2015)
- **Decision Factors** (Dedrick and West 2004; Johnston et al. 2013)
 - Long-term support
 - Internal resources
 - Performance
 - Cost
 - Freedom

Framework for Studying OSS/P Adoption

(Fitzgerald et al. 2011, p. 15)

Research Question

- How can the level of OSS/P adoption in organizations be assessed?

Our Definition of OSS/P Adoption

- When employees engage with and contribute to open source communities
- or when their internal software development practices are similar to those used by open source communities.

Operationalization

- **Build on adoption literature**
(Howison and Crowston 2014; Thanasopon 2015; Torkar et al. 2011)
- **Survey instrument**
 - Involvement – participation in OSS communities
 - Transparency – openness within the organization
 - Practices – software development practices
- **Respondents: IT department employees**
- **OSS scholar reviewed instrument**

Pilot Study

- Telecommunications Company
- 23 respondents
- Gathered over one week
- Engineering Infrastructure Groups
 - Middleware
 - Software Development
 - Telecommunications

Measurements

- Web based survey
 - Limited sample, but reliable.
 - Cronbach's $\alpha=.817$
 - mean inter-item correlation: .293
 - Personal participation – removed: 11 items, $\alpha=.832$
 - Subscales
 - Involvement: 5 items ($\alpha=.784$)
 - Transparency: 2 items ($\alpha=.771$)
 - Practices: 4 items ($\alpha=.458$)

Instrument refinement

- Follow up interviews
 - Explanations were ignored by participants
 - Ambiguous terms
 - Change stack
 - Technical debt
 - Communications
 - Asynchronous and synchronous communication

Ambiguity

“To what degree does your organization maintain a ***change stack*** for open source software it uses?”

“To what degree does your organization use ***asynchronous*** tools, such as emails, to make software development related decisions?”

Survey Design

* To what degree does your organization maintain small software development tasks that you can pick up when you have time and complete independently?

1: Tasks are too large or complex that I cannot just pick one up when I have some spare time

2

3: A few tasks I can do when I have a slow time

4

5: I can pick almost any task and complete it independently in a short amount of time

N/A

Don't know

Task size

[Description/Example:](#) Tasks can be small and independent where one person can go choose any task and complete it. The alternative are large tasks that require a long time to complete and potentially need coordination with other developers.

Conclusions

- Developed a survey instrument
- Ran a pilot study, data collection
- Exploratory factor analysis
- Followed up through interviews
- Applied feedback to instrument

- Next steps:
 - Scale instrument validation
 - Evaluate influence of culture on adoption
